

LECTURE: 16

Date:

HOW TO RUN A USER INTERVIEW (Emmett Shear)

- * Most startups are not just even built for the people who are using them.
- * Your things turn out to be a side project that does not go anywhere.
- * How to build anything beyond that tv show.
- * Pivot the Justin tv and go in a new direction.
- *

Go and talk to the users

- * Acquiring the content and building the large number of interviews about how you would be working out.

- * Who you talk to is similarly as important as by asking the questions you are going to be asking from the users.
- * This allows you to have a different set of feedback.

Think about who would you go and ask about this?

- * Who are the most important one's people into the question itself.
- * Who is your user and where are you going to find them.
- * Talk to the it administrators for college and they are critical and bring out the ideas while working on the things that are familiar with them previously.
- * Google docs and evernotes itself, if it's a group project or something like that.
- * The design, the formatting, color and the study.

* The figure out how there is actually a smaller or a bigger area within the question of the mind.

* You are expected to have different sets of things that are going to be working towards on those skills and the situations.

IDEAS

* Build one feature on top of everything

* What you might do to bring the users from a different platform to your platform.

* Focus on the thing you get out of the user interviews.

BUILD SOMETHING AND SHOW OUT TO OTHERS

* Don't go out and say to come up with a feature idea.

* User feedback is bad and you can't ask that if something is good or not.

* Think something just together.

* The trial version is free and the money stuff is going to tell you that either your idea/product is going to work out or not.

* A bunch of stuff around not and interactivity itself is something that they are not going to be the problems.

- * Complicated about not having a shared program itself.
- * Non Broadcast feedback with the features.

You are not learning the things.
that are going to help you expand
the size of the market.

- * Broadcast our practice sessions and help them game out with the variables itself.
- * The features don't have to be built out itself.
- * The people wanted the money, resources and the applications itself.

Common Mistakes

- * Showing people your product.
- * Asking about your pet feature direction.
- * Talking to who's available rather than talking to who needs to be worked.
- * Bring in the people with whom you really need to talk too.
- * Record interviews and then play that recording for the people.
- * Interviews with the things are non-interactive. Feedback and then pull out your resources.
- * It's hard to talk to users abroad and ask about your use and then run in the interview of the events.
- * Not having any trouble to understand those sketches.
- * Helps you understand that what went wrong before actually using it and what do they come about as the humans.

BRING IN THE PEOPLE
WHO ARE GOING TO BE
THE USERS.

- * What about the game publishers because you just don't need to talk with them considering about the constituency of the program.
- * It is important to keep doing things and stop asking the users about it.
- * Be willing to talk about the things that are going to be utilized in the same working principles.
