

LECTURE: 12

BUILDING FOR THE ENTERPRISE (Amazon, Google)

* Why you want to build enterprise software:

→ In 2004 it was really hard to start AWS.

IDENTIFY RAPIDLY CHANGING FACTORS

* For consumer build a very robust, comprehensive product and create a significant product for enterprises.

* At the consumer side, you are always figuring it out that how do you monetize and ask the customers to pay for your products.

→ Make people pay on the product

→ Provide advertisement on the application.

* In the enterprises, they are focused on increasing the productivity and get higher amount of performance of their business.

Slow, Expensive Complex and Sales

* The sales are one of the most important aspect when it comes to a business.

We would do the enterprise IT as could be done differently

* Architected the business model, software solution and the other decisions.

Everything has changed.

IT-LED

USER-LED

* Decoder of infrastructure.

* It becomes easier to adopt to new situations.

* You can now serve a large business, everywhere in the world.

No incumbent has built a technology solution that leads the generations ahead.

* Every industry is changing and the technology revolution is changing.

* What are the implications of the other things to your business model.

* Take any industry you want and work on the linear programming.

Every company in the world needs better technology to work smarter, faster, more securely.

* You don't think about technology as a way to learn about those markets.

FOCUS ON THE USER

Date

- * They don't have competency in leveraging the technology.
- * This ultimately changes the business models of these companies.

How do you get started?

- * This is not how things always happen, but may give you some of the ways through which the enterprise software works out.

* 1) Spot technology disruptions

- * Look for new enabling technologies that create a wide gap between how things have been done and how they can be done.

a) Intentionally start small

- * Start with something simple and small, then you expand over time.
- * If people call it a "toy", you're definitely onto something.

2) FIND Asymmetries

- * Do things that incumbents can't or won't do because it's economically or technically infeasible.

- * Usually people will feel like that you are going crazy.

4) Find the almost crazy outliers

- * Go after the customers that are working in the future but that haven't totally lost their minds.

5) LISTEN TO CUSTOMERS

- But don't always build exactly what they want. Build exactly what they need.
